

Baselight 4.3

NUKE Plugin

FilmLight

The Baselight Plugin for NUKE brings the powerful Baselight grading toolset directly into the VFX pipeline.

With a single Baselight Plugin node you can apply several separate grading layers. Each layer has the ability to act either as an overall primary colour correction, or as a secondary correction layer allowing you to restrict the effect to selected parts of the image using bezier shapes, keys and external mattes. Secondary grades work as inside/outside layers where separate grades and filter effects can be applied both 'inside' and 'outside' the matte.

All grading data can be seamlessly exchanged between the Plugin and a full Baselight system and our world-renowned Truelight colour management system is built into the Baselight Plugin, allowing the VFX artist to accurately

preview fully graded shots without any need for rendered material from the grading suite. The Baselight Plugin and full Baselight systems can also share a common database, allowing changes to the grade to be reflected immediately within the NUKE workstation.

The Baselight Plugin UI provides an extensive subset of Baselight grading tools and effects. However, where projects are imported from a full Baselight system all elements and operators will be rendered, even if their controls are not accessible within the plugin. This enables the final render to be processed through NUKE without the need to return to a separate Baselight system.
